Natural Remedies for Polycystic Ovarian Syndrome (PCOS) : A Review

Priyanka Kantivan Goswami, Dr. Anubha Khale, Sunita Ogale

H K College of Pharmacy, Jogeshwari (West), Mumbai- 400102

ABSTRACT
Polycystic ovarian syndrome (PCOS) is a heterogeneous endocrine disorder that affects about one in 15 women worldwide. It is a major disorder characterized by elevated levels of male hormones (androgens), acne and hirsutism. It can even cause insulin resistance, anovulation and infertility on prolong incidence of cysts. Since PCOS is a curable disorder, it can be cured by use of natural remedies or allopathic medication. The natural remedies include treatment with phytoestrogenic and non-estrogenic herbs such as Liquorice, Ginseng, Black cohosh, Dong qu, Hops and Kelp which are effective and safe. In this review, an attempt has been made to study the use of natural remedy for treatment of PCOS.

Key Words: PCOS, Hormone, Liquorice, Ginseng, Exercise

INTRODUCTION
Herbs can be defined generally in commerce as a plant, plant part or extract there of used for flavour, fragrance or medicinal purposes. Traditional herbal medicines are naturally occurring substances with minimal or no industrial processing that have been used to treat various illnesses. Traditional herbal medicines are getting significant attention in global health debates. Traditional medicine has established promotive, preventive, curative and rehabilitative role\(^1-3\). Herbal therapy has reached a turning point. It is fighting to be recognised as a science-a particular field with its own identity. It has become necessary to show that herbal therapy can match other fields of medicine in the thoroughness of its scientific work and its practical use. Benefit of herbal therapy compared to conventional therapy is that herbal therapy is safe with lesser side effects and presence of multiple active compounds in medicinal herbs altogether provides a potentiating effect\(^4-5\).

The polycystic ovary syndrome is originally called as the Stein–Leventhal syndrome. Polycystic Ovarian Syndrome (PCOS) is a serious disorder in women in which the ovaries become enlarged with many ‘cysts’ which are in fact small undeveloped follicles. Over time there is thickening and fibrosis of the ovarian casing which prevents any follicles which do ripen from being released. PCOS is associated with anovulation and menstrual irregularities, infertility and insulin resistance. There may be acne, hirsutism and weight gain. As the condition progresses it may become associated with dysfunctional uterine bleeding, obesity, Type 2 diabetes, endometrial cancer, high cholesterol and cardiovascular disease\(^6-7\).

CAUSES OF PCOS
Following are few important causes\(^8\) of PCOS:

1) Genetic predisposition
2) Strong stimulation in adrenals in childhood
3) Raised insulin levels
4) Contraceptive pills
5) Hormonal imbalance
6) Stress

Fig.1: Polycystic Ovary

Fig.2: Role of Hypothalamus in PCOS
SIGN AND SYMPTOMS OF PCOS
The principal signs and symptoms of PCOS are:
1) Irregular or absence of periods
2) Acne
3) Excess body hair (hirsutism)
4) Weight gain or difficulty losing weight
5) Pain in pelvic region
6) Elevated Luteinizing Hormone (LH) and decreased Follicle stimulating hormone (FSH)
7) Infertility (difficulty becoming pregnant)

HISTOLOGICAL FEATURES OF PCOS
Histological features of PCOS includes:
1) Whole ovarian hypertrophy
2) Thickened capsule (>100 µ)
3) Increased number of subcapsular follicle cysts
4) Scarcity of corpora lutea or albicantia
5) Hyperplasia and fibrosis of the ovarian stroma
6) Premature luteinization of theca cells

ALLOPATHIC THERAPY FOR PCOS
1) Nafarelin—a specific gonadotropin-releasing-hormone agonist
2) Triglitazone
3) Clomiphene
4) Metformin
5) Spironolactone
6) Laparoscopy

ALTERNATIVE REMEDIES AVAILABLE FOR PCOS
1. Medicinal Herbs
Liquorice
(Botanical Name: Glycyrrhiza glabra, Family: Leguminosae)

The effect of liquorice was investigated on androgen metabolism in nine healthy women 22–26 years old, in the luteal phase of the cycle. They were given 3.5 g of a commercial preparation of liquorice (containing 7.6% W/W of glycyrrhizic acid) daily for two cycles. They were not on any other treatment. Plasma renin activity, serum adrenal and gonadal androgens, aldosterone, and cortisol were measured by radioimmunoassay. Total serum testosterone decreased gradually within two months. It returned to pretreatment levels after discontinuation. Licorice can reduce serum testosterone probably due to the block of 17-hydroxysteroid dehydrogenase and 17–20 lyase. Licorice could be considered an adjuvant therapy of hirsutism and polycystic ovary syndrome.

Spearmint Tea
(Botanical Name: Mentha spicata, Family: Labiatae)

The study was carried out in Turkey in a two centre as 30 day randomized controlled trial. Forty two volunteers were randomized to take spearmint tea twice a day for a 1 month period and compared with a placebo herbal tea. At 0, 15 and 30 days of the study serum androgen hormone levels and gonadotropin were checked; the degree of hirsutism was clinically rated. 41 out of 42 patients completed the study. Free and total testosterone levels and degree of hirsutism were reduced over the 30 day period in the spearmint tea group. LH and FSH were increased. It was demonstrated and confirmed that spearmint has antiandrogen properties.

Ginseng saponin
(Botanical Name: Panax ginseng, Family: Araliaceae)

Female Sprague-Dawley rats (190-210 g) were induced polycystic ovary with intramuscular injection of Estradiol Valerate (EV) and separated into three groups: EV control (n=10), EV plus Ginseng Total Saponins (n=10), and oil control (n=10). Ovarian morphology and Nerve Growth Factor (NGF) protein expression were observed. Increased expression of Nerve Growth Factor was noted in the ovaries and the brain of rats with Poly Cystic Ovary. Ginseng Total Saponins administration attenuated NGF expression in the ovaries.

Flaxseed
(Botanical Name: Linum usitatissimum, Family: Linaceae)

In this study the impact of flaxseed supplementation (30 g/day) on hormonal levels in a 31-year old woman with...
PCOS was observed. During a four month period, the patient consumed 83% of the flaxseed dose. Height, weight measurement and fasting blood samples taken at baseline and 4-month follow-up indicated significant decrease in Body Mass Index (BMI), insulin, total serum testosterone and free serum testosterone levels. The patient also reported a decrease in hirsutism at the completion of the study period. The clinically-significant decrease in androgen levels with a concomitant reduction in hirsutism reported in this case study\textsuperscript{20}.

**Aloe vera**  
(Botanical Name: *Aloe barbadensis*, Family: Liliaceae)

In the present study, the efficacy of Aloe vera gel formulation in a PCOS rat model was checked. Five month old Charles Foster female rats were orally fed with letrozole, a non-steroidal aromatase inhibitor, to induce PCOS. The rats were then treated orally with the Aloe vera gel formulation (1 ml dose daily for 45 days). This restored their estrus cyclicity, glucose sensitivity, and steroidogenic activity. Co-treatment of the inductive agent (letrozole) with the Aloe vera gel prevented the development of the PCO phenotype. Aloe vera gel formulation exerts a protective effect in against the PCOS phenotype by restoring the ovarian steroid status, and altering key steroidogenic activity. This can be attributed to phyto-components present in the extract\textsuperscript{21}.

**Cinnamon**  
(Botanical Name: *Cinnamomum zeylanicum*, Family: Lauraceae)

Cinnamon extract has been shown to reduce insulin resistance in in vitro and in vivo studies by increasing phosphatidylinositol 3-kinase activity in the insulin signaling pathway and thus potentiating insulin action. Fifteen women with polycystic ovary syndrome (PCOS) were randomized to daily oral cinnamon and placebo for 8 weeks. Comparisons of post-treatment to baseline insulin sensitivity indices using fasting and 2-hour oral glucose tolerance tests showed significant reductions in insulin resistance in the cinnamon group but not in the placebo group\textsuperscript{22}.

**Chaste berry**  
(Botanical Name: *Vitex agnus-castus*, Family: Lamiaceae)

In this study, 93 women who had tried to conceive for 6-36 months were given a supplement containing chaste tree, L-arginine, vitamins and minerals. Their progesterone level, menstrual cycle length, pregnancy rate and side effects were documented. After 3 months, the supplementation group demonstrated increased mid-luteal progesterone and normalized menstrual cycles compared to no significant changes in the placebo group. 14 out of the 53 women who received the supplement became pregnant as compared to 4 of the 40 women who received placebo. 3 other women in the supplement group conceived after 6 months. The recommended dose is 1-4 ml of 1:2 dried plant tincture of 500-1000 mg of dried berries daily\textsuperscript{23}.

**White peony**  
(Botanical Name: *Paeonia lactiflora*, Family: Paeoniaceae)

In the present study, we investigated the in vivo effects of unkei-to (Japanese herbal medicine) and its compounds on the steroidogenesis and cytokine secretion in human granulosa cells. Unkei-to stimulate the secretions of 17-beta-oestradiol and progesterone from highly luteinized granulosa cells obtained from in vitro fertilization patients. Effect observed due to its key ingredients like *Paeoniae radix*, *Paeonia lactiflora*, *Cinnamomum cortex* and *Cinnamomum cassia*. The various beneficial actions of unkei-to on the ovary may result from a combination of different ingredient herbs with different stimulatory effects on both steroidogenesis and the ovulatory process within the ovary, as well as stimulatory effect on the hypothalamus-pituitary axis\textsuperscript{24-25}.
In this study, the effect of silymarin which is known to have insulin sensitivity effects on the levels of glucose, insulin, testosterone, leutinizing hormone (LH) and progesterone was tested. Ovulation rate and Homeostasis Model Assessment of insulin Resistance (HOMA) ratio were determined. A 3-months of treatment were conducted in 60 PCOS patients in three well-matched groups. The first one (n=20), received silymarin (750mg/day). The second group received metformin (1500mg/day) while the third group treated by combination of metformin (1500mg/day) and silymarin (750mg/day). All these groups had taken the drugs in divided doses. The results showed significant increment in progesterone levels after completion of treatment. In conclusion the addition of silymarin to metformin in treatment of PCOS patients has improving effect on disturbed hormones and ovulation rate.

N-acetyl cysteine (NAC)
(Source: amino acid derivative of cysteine)
One hundred fifty women diagnosed with Clomiphene citrate (CC) resistant PCOS; aged 18-39 years, undergoing therapy for infertility were selected. The patients were assigned randomly to receive either NAC 1.2 gm/day (group I) or placebo (group II) with CC 100 mg/day for 5 days starting at day 3 of the cycle. Ovulation rate and pregnancy rate were observed. Combination of CC and NAC significantly increased both ovulation and pregnancy rate and PR in women with CC-resistant PCOS.

D-chiro-inositol
(Source: breakdown of phytic acids found in vegetables, fruits, legumes, nuts and whole grains)
In this study 44 obese women with PCOS were selected for clinical trial. Serum steroids and glucose tolerance tests were carried out before and after the oral administration of 1200 mg of D-chiro-inositol or placebo once daily for six to eight weeks. The serum progesterone concentration was measured weekly to monitor for ovulation. The level of serum free testosterone, plasma triglyceride and blood pressure was found to be decreased and 19 out of the 22 women who received D-chiro-inositol ovulated.

Kasip Fatimah
(Botanical Name: Labisia pumila var. alata, Family: Myrsinaceae)
In this study, effect of a Malaysian herb Kasip Fatimah had been checked on 9 week old PCOS rats. PCOS was induced in female rats before puberty by treating continuously with dihyrotestosterone. The PCOS rats were randomly subdivided into two groups; PCOS herb treated and PCOS control.
blood lipid were evaluated before and after the therapy. After the treatment, fasting serum insulin levels, LH/FSH ratio was found be reduced and insulin sensitivity index increased significantly. Astragalus polysaccharides plus diane-35 can be effective in improving insulin resistance, high androgen hormone status and lipid metabolism in patients with PCOS and it may be alternative for PCOS\textsuperscript{13}.

2. Acupuncture

Poly cystic ovary syndrome (PCOS) is associated with peripheral and central factors that influence sympathetic nerve activity. Thus, the sympathetic nervous system may be an important factor in the development and maintenance of PCOS. Acupuncture can affect PCOS via modulation of endogenous regulatory systems, including the sympathetic nervous system, the endocrine and the neuroendocrine system\textsuperscript{13}.

3. Life Style Modification

a. Exercise

The study was carried out to check whether 5 weeks of voluntary exercise influence ovarian morphology and the expression of sympathetic markers in the Estradiol Valerate (EV)-induced PCO rat model. The effect of exercise on (i) ovarian morphology; (ii) mRNA and protein expression of nerve growth factor (NGF); and (iii) mRNA and number of ovarian-expressing cells for the NGF receptor (p75 neurotrophin receptor) and the α1a-, α1b-, α1d- and β2-adrenergic receptors (ARs) in rats with EV-induced PCO was evaluated. PCO was induced by a single intramuscular injection of EV, and controls were injected with oil alone in adult cycling rats. The rats were divided into four groups: (i) control (oil); (ii) exercise group (oil + exercise); (iii) a PCO group (EV); and (iv) a PCO exercise group (EV + exercise). The exercise and PCO exercise groups ran voluntarily for 5 weeks in computer-monitored wheels placed in the cages where they were housed. The results obtained indicated that ovarian morphology was almost normalised in the PCO exercise group; NGF mRNA and protein concentrations were normalised in the PCO exercise group; high numbers of NGF receptor expressing cells in PCO ovaries were lowered by exercise; and the number of immunopositive cells of the different AR subtypes were all reduced after exercise in the PCO group, except for the α1b- and β2-AR whereas the mRNA levels were unaffected, indicating transcriptional regulation. In conclusion, our data indicate a beneficial effect of regular exercise, as a modulator of ovarian sympathetic innervation, in the prevention and treatment of human PCOS\textsuperscript{38}.

b. Dietary intake

Low glycemic index diet may helps to manage insulin resistance, cardiovascular risk and irregular menstrual patterns in women with PCOS. One should avoid saturated fat intake. Lifestyle modification, including effective exercise regimen and dietary advice, should be the first line of treatment in women with polycystic ovary syndrome\textsuperscript{39,37}.

FUTURE COMPLICATION OF PCOS

1) Cardio vascular disorders\textsuperscript{38,39}
2) Diabetes mellitus\textsuperscript{38}
3) Obesity\textsuperscript{38}
4) Metabolic syndrome\textsuperscript{41}
5) Endometrial carcinoma\textsuperscript{42}

CONCLUSION
Polycystic Ovarian Syndrome (PCOS) is one of the most common female endocrine disorders which may leads to infertility. Herbal drugs have promising role in treatment of PCOS and shows steady effect with minimal side effects. Herbal drugs enhance immunity of the body and also regularize menstrual cycle without fluctuating hormonal level. For regulating menstrual cycle, various poly herbal supplements are being used in India, viz. Evecare syrup-capsule and Geriforte tablets (Himalaya healthcare), M2 Tone Forte syrup (Charak Pharma), Mensta syrup (Dabur India) and Mensonorm capsule (Chirayu Pharma). These herbal supplements, not only prevent ovarian cysts but also cure them. Herbal supplements may take time to cure PCOS but daily usage may treat the disease from its root.
